## Executive Summary

*A hotel has developed a system, "RoomServe", to manage room bookings, check-ins, and billing. It must handle multiple users at once, ensuring that no overbookings occur and that billing is accurate.*

# 1.INTRODUCTION

## 1) PURPOSE OF THE REPORT

This report outlines the testing and evaluation of Room Serve, a hotel management system designed to efficiently manage bookings, check-ins, and billing. The primary objectives are:

## 2) TEST OBJECTIVES

1. Verify system functionality and performance.
2. Ensure security and data integrity.
3. Validate user interface and user experience.
4. Identity and report defects.

## 3) SCOPE OF THE TESTING ACTIVITIES

- Room management
- Guest information
- Payment Processing

## 2.TEST PLAN

|                                  |  |
|----------------------------------|--|
| <b>Test plan identifier</b>      | <b>HMS_TP001</b>   |
| <b>Introduction</b>              | The Room Booking and Check-In Test Plan aims to ensure seamless and efficient room booking and check-in processes for guests, while validating accuracy of guest information, correct room assignment, and secure payment processing. This comprehensive test plan covers various scenarios, including successful bookings, cancellations, modifications, and payment processing errors. The hotel industry relies heavily on efficient room booking and check-in processes to provide exceptional guest experiences. With the increasing demand for online bookings and mobile check-ins, hotels must ensure their systems are reliable, secure, and user-friendly. |
| <b>Test Items</b>                | <ul style="list-style-type: none"><li>• Reservation management</li><li>• Guest information systems</li><li>• Booking engine</li><li>• Guest check in /check out</li><li>• Check in/check out Reporting</li></ul>   |
| <b>Features to be tested</b>     | <ul style="list-style-type: none"><li>• Search for available rooms by date, room type and rate</li><li>• Enter guest information (name, email, phone number</li><li>• Present ID and confirmation number</li><li>• Receive room key and welcome package</li></ul>  |
| <b>Features not to be tested</b> | <b>Room Booking:</b><br><ol style="list-style-type: none"><li>1. Room availability display (assuming accurate data)</li><li>2. Room type and rate information</li><li>3. Booking success/failure messages</li></ol><br><b>Check-in:</b><br><ol style="list-style-type: none"><li>1. Guest information storage and retrieval</li><li>2. Automatic room assignment (if implemented)</li><li>3. Check-in/check-out date and time validation</li></ol>   |
| <b>Approach</b>                  | In this test plan we chose to use exploratory testing approach because it's flexible and can be tailored to the specific needs of the project and it is also a good way to find bugs that will be difficult to find with other testing methods.<br>We will be using black box testing; on black box techniques we chose Equivalence Partitioning testing and State Transition Testing. The reason being Equivalence partitioning testing will help us divide input data into partitions based on requirements and reduce number of test cases, as for State Transition testing it is because it verifies the system behaviour across different states.               |

[Type here]

|  |   |
|--|---|
|  | <p>Functional testing approach to avoid post-launch issues. It will touch on the important traits that are crucial for customer satisfaction and retention. This approach will be used to validate that all the features work according to the assumed requirements. It will use both manual and automated testing techniques. It will test on the following levels of testing:</p> <ul style="list-style-type: none"> <li>• System level: Test all parts of the site to see if they work all together.</li> <li>• Acceptance testing: end-users will test the system and give feedback.</li> </ul>                     |
| <b>Items pass/fail criteria</b>                        | <p>If the test passes, room booking is successful with valid input data<br/> Check in process completes without errors<br/> Room assignment matches booking details<br/> But if it fails, check in process encounters errors<br/> Payment processing fails and booking confirmation or receipt is not generated</p>   |
| <b>Suspension criteria and resumption requirements</b> | <ul style="list-style-type: none"> <li>• System crashes or freezes frequently</li> <li>• Data corruption or loss</li> <li>• Security vulnerabilities for example (exposed passwords)</li> <li>• Critical functionality not working for example (booking payment)</li> <li>• Unrecoverable errors</li> </ul>   |
| <b>Test deliverables</b>                               | <ul style="list-style-type: none"> <li>• Test plan</li> <li>• The detailed reports, including the list of all tests that were performed and results for each</li> <li>• Test case documents</li> <li>• Bug Reports</li> <li>• List of any features that were not tested or require further testing</li> <li>• Summary of the overall test results</li> </ul>  |
| <b>Testing tasks</b>                                   | <ul style="list-style-type: none"> <li>• Functional testing: Checks the System features work as expected</li> <li>• Usability testing: Evaluates the website's user experience</li> <li>• Compatibility Testing: Checks that the website works with different devices and operating systems.</li> <li>• Performance Testing: Checks the systems performance under heavy load, speed and responsiveness.</li> <li>• Accessibility testing: Ensures that the system is accessible to people with special needs.</li> <li>• Localization: Ensures that the system is usable in different languages and regions.</li> </ul> |
| <b>Environmental needs</b>                             | <p><b>Network setups</b></p> <ul style="list-style-type: none"> <li>• Local area network (LAN) Testing</li> <li>• Wide area network (WAN) Testing</li> <li>• Wireless and WI-FI network testing</li> </ul> <p><b>Hardware:</b></p> <ul style="list-style-type: none"> <li>• Laptops, Mobile and Computers</li> </ul>  |

- Ensure redundant network connections.
- Monitor network performance.
- Implement failover mechanisms.

Mitigation Strategies:

1. Risk assessment and prioritization.
2. Regular system maintenance.
3. Continuous monitoring.
4. Testing and validation.
5. Collaboration with stakeholders.
6. Development of backup and recovery plans.
7. Implementation of security measures.
8. Performance optimization.
9. Network redundancy.
10. Contingency planning.

Benefits:

1. Reduced downtime

| Test Plan Content    | Description  |
| Test plan identifier | RoomServe_003  |
| Introduction         | This Test plan aims to verify accurate billing calculations and correct payments in a hotel management system. The system's billing is responsible for generating invoices, processing payments, and |

|                                  |   |
|----------------------------------|---|
|                                  | managing revenue. check if the user can successfully complete the booking, verify that different methods are supported, and the billing is correct and accurate.  |
| <b>Test items</b>                | <ul style="list-style-type: none"> <li>• Credit card processing (authorization, capture, refund)</li> <li>• Payment method validation (card number, expiration date)</li> <li>• Room rate calculations</li> <li>• Online method gateway</li> </ul>  |
| <b>Features to tested</b>        | <ul style="list-style-type: none"> <li>• Payment processing</li> <li>• Automatic billing for long-stay guests</li> <li>• Credit card processing</li> <li>• Payment methods</li> </ul>   |
| <b>Features not to be testes</b> | <ul style="list-style-type: none"> <li>• User interface design</li> <li>• Network connectivity and infrastructure</li> <li>• Inventory management (non-room related)</li> </ul>   |
| <b>Approach</b>                  | <p>use exploratory testing approach because it's flexible and can be tailored to the specific needs of the project and it is also a good way to find bugs that will be difficult to find with other testing methods.</p> <p>We will be using black box testing; on black box techniques we chose Equivalence Partitioning testing and State Transition Testing. Reason being Equivalence partitioning testing will help us divide input data into partitions based on requirements and reduce number of test cases, as for State Transition testing it is because it verifies the system behaviour across different states.</p> <p>Functional testing approach to avoid post-launch issues. It will touch on the important traits that are crucial for customer satisfaction and retention. This approach will be used to validate that all the features work according to the assumed requirements. It will use both manual and automated testing techniques. It will test on the following levels of testing:</p> <ul style="list-style-type: none"> <li>• System level: Test all parts of the site to see if they work all together.</li> <li>• Acceptance testing: end-users will test the system and give feedback.</li> </ul> |
| <b>Item pass/fail criteria</b>   | <ul style="list-style-type: none"> <li>• <u>Total Billing Amount</u></li> </ul> <p>Pass: Total billing amount calculated correctly, including room rate, tax, and discount.<br/>Fail: Total billing amount calculation error or discrepancy.</p>  |

[Type here]

|  |   |
|--|---|
|  | <ul style="list-style-type: none"> <li>• <u>Payment Method Validation</u></li> </ul> <p>Pass: Payment method validated correctly (e.g credit card, debit card, cash).<br/>Fail: Payment method validation error or failure</p>  |
|  | <ul style="list-style-type: none"> <li>• The actual output and the expected output for valid inputs are compared, if actual output is equal to the expected output, then the test is passed.</li> <li>• The actual and expected out for invalid inputs are compared; if the actual output is equal to the expected output, then the test has passed.</li> <li>• Then a conclusion will be made as for the proper functioning of the website under test.</li> </ul>  |
| <b>Suspension Criteria and resumption requirements</b> | <p><u>Testing will be suspended if:</u></p> <ul style="list-style-type: none"> <li>• All the equivalence partitions have been thoroughly tested.</li> <li>• Repeated testing of the same partitions doesn't reveal new defects.</li> <li>• If the system demonstrates consistent behaviour and no critical defects are found.</li> </ul> <p><u>Testing will resume after:</u></p> <ul style="list-style-type: none"> <li>• Requirements or features are added.</li> <li>• Defects are fixed and re-testing is necessary.</li> <li>• The system undergoes updates or upgrades.</li> </ul>                                |
| <b>Testing tasks</b>                                   | <ul style="list-style-type: none"> <li>• Functional testing: Checks the System features work as expected</li> <li>• Usability testing: Evaluates the website's user experience</li> <li>• Compatibility Testing: Checks that the website works with different devices and operating systems.</li> <li>• Performance Testing: Checks the systems performance under heavy load, speed and responsiveness.</li> <li>• Accessibility testing: Ensures that the system is accessible to people with special needs.</li> <li>• Localization: Ensures that the system is usable in different languages and regions.</li> </ul> |
| <b>Environmental needs</b>                             | <p><u>Network setups:</u></p> <ul style="list-style-type: none"> <li>• Local area network (LAN) Testing</li> <li>• Wide area network (WAN) Testing</li> <li>• Wireless and WI-FI network testing</li> </ul>   |

|                              |   |
|------------------------------|---|
| <b>Introduction</b>          | The test objectives is to verify integration with third-party services, to ensure seamless data exchange between HMS and third party services, to validate accurate processing of transaction and bookings, as well as to identify and to report defects or integration issues.   |
| <b>Test items</b>            | <p><b>Payment Gateways:</b></p> <ol style="list-style-type: none"> <li><u>Payment processing</u> <ul style="list-style-type: none"> <li>- successful payment processing</li> <li>- failed payment processing</li> <li>- payment cancellation/refund.</li> </ul> </li> <li><u>Payment methods</u> <ul style="list-style-type: none"> <li>- Credit card</li> <li>- Debit card</li> <li>- Online banking</li> <li>- Wallet payment</li> </ul> </li> <li><u>Transaction status updates</u> <ul style="list-style-type: none"> <li>- Payment pending</li> <li>- Payment successful</li> <li>- Payment failed</li> </ul> </li> </ol> <p><b>Booking websites:</b></p> <ol style="list-style-type: none"> <li>Booking creation <ul style="list-style-type: none"> <li>- Successful booking creation</li> <li>- Failed booking creation (e.g., room unavailable)</li> <li>- Booking cancellation</li> </ul> </li> <li>Booking data synchronization: <ul style="list-style-type: none"> <li>- Room availability updates</li> <li>- Rate and inventory updates</li> <li>- Guest information updates</li> </ul> </li> <li>Booking status updates <ul style="list-style-type: none"> <li>- Booked</li> <li>- Checked-in</li> <li>- Checked-out</li> <li>- Cancelled</li> </ul> </li> </ol> |
| <b>Features to be tested</b> | <p><b>1. Payment gateways</b></p> <ul style="list-style-type: none"> <li>- Payment processing</li> <li>- Payment method support</li> </ul>  |

[Type here]

|  |   |
|--|---|
|  | <ul style="list-style-type: none"> <li>- Payment status updates</li> <li>- Payment cancellation</li> </ul> <b>2. Booking websites</b> <ul style="list-style-type: none"> <li>- Booking creation</li> <li>- Booking data synchronization (e.g., room availability and rates)</li> <li>- Booking status updates</li> </ul>  |
| <b>Features not to be tested</b>                       | <b>Payment Gateways</b> <ul style="list-style-type: none"> <li>- Payment gateways internal functionality</li> <li>- Payment gateways administrative interface</li> <li>- Payment gateways reporting and analytics.</li> </ul> <b>Booking websites</b> <ul style="list-style-type: none"> <li>- Booking websites user interface and user experience</li> <li>- Booking websites search and filtering functionality.</li> <li>- Booking websites loyalty programs (if not integrated with HMS)</li> </ul> |
| <b>Approach</b>  | black box testing: on black box techniques we chose Equivalence Partitioning testing and State Transition Testing. Reason being Equivalence partitioning testing will help us divide input data into partitions based on requirements and reduce number of test cases, as for State Transition testing it is because it verifies the system behaviour across different states.  |
| <b>Items pass/fail criteria</b>                        | <ol style="list-style-type: none"> <li>1. Payment gateways <ul style="list-style-type: none"> <li>- Pass: successful payment processing with valid payment information</li> <li>- Fail: payment processing fails with valid payment information</li> </ul> </li> <li>2. Booking websites <ul style="list-style-type: none"> <li>- Pass: bookings are successfully created and reflected in HMS</li> <li>- Fail: bookings fail to create or not reflected in HMS</li> </ul> </li> </ol>                  |
| <b>Suspension criteria and resumption requirements</b> | <ol style="list-style-type: none"> <li>1. Suspension Criteria: <ul style="list-style-type: none"> <li>- Critical defects</li> <li>- Major defects</li> <li>- System crashes</li> <li>- Data corruption</li> </ul> </li> <li>2. Resumption Requirements <ul style="list-style-type: none"> <li>- Critical defects fixed</li> <li>- Major defects mitigated</li> <li>- System stability</li> <li>- Data integrity</li> </ul> </li> </ol>  |

### 3. TEST CASE SPECIFICATION

**Test Case ID:** TC\_BOOKING\_01 **Test Case Description:** Verify booking functionality

**Created By:** KELEBOGILE MAKHUDU **Reviewed By:** LIYABONA **Version:** 01

**Tester's Name:** KELEBOGILE MAKHUDU **Date Tested:** 22 September 2023

**Prerequisites:**

1. Access to Chrome Browser, Safari and Microsoft edge browser
2. <https://www.roomserve.com>

**Test data:**

- Booking date
- Room type

**Test Scenario:** Check booking process functionality

| Step# | Step Details  | Expected Results   | Actual Results | Outcome |
|-------|---|--|----------------|---------|
| 1.    | Navigate to <a href="https://www.roomserve.com">https://www.roomserve.com</a> | Site should open   | As expected,   | Pass    |
| 2.    | Enter valid credentials, then click login button                              | A pop-up screen will appear confirming "Sign in successful"  | As expected,   | Pass    |
| 3.    | Click the bookings button to view the services on it                          | Display services with their pictures,names,description,prices,and make a booking button  | As expected,   | Pass    |
| 4     | Click on the "make a booking" button  | A user is expected to enter the details of the booking they want together with personal details and card number  | As expected,   | Pass    |
| 5.    | After filling in the required details then click the book button              | Pop up screen will appear confirming successful booking "thank you for booking" with booking id, the amount, card number, customer name, date and an ok button | As expected,   | Pass    |
| 6.    | Click the bookings option to view the items on it                             | Display services with their pictures, titles, prices, a delete option, edit button, and total amount of the booking.   | As expected,   | Pass    |

**Test Case ID:** TC\_CHECK-IN\_02 **Test Case Description:** Successful check-in

**Created By:** TAKALANI MASHAU **Reviewed By:** NAANDA **Version:** 01

[Type here]

**Tester's Name:** KELEBOGILE MAKHUDU **Date Tested:** 22 September 2023

**Prerequisites:** <https://www.roomserve.com>

**Test Data:**

- Booking ID
- Guest details
- Room type and date

**Test Scenario:** Check-in functionality

| Step# | Step Details                                | Expected Results                                    | Actual Results | Outcome |
|-------|---|---|----------------|---------|
| 1.    | Booking is confirmed                        | User gets a confirmation with their booking details | As expected,   | pass    |
| 2.    | Verify guest's identity and booking details | Guest details and booking details are valid         | As expected,   | pass    |
| 3.    | Front desk staff issues key card            | Guest receives correct room key card                | As expected,   | pass    |
| 4.    | Guest inspects room                         | Room matches booking details                        | As expected,   | pass    |
| 5.    | Front desk staff confirms check-in          | Check-in process is successful                      | As expected,   | pass    |

**Test Case ID:** TC\_BILLING\_03 **Test Case Description:** Billing calculation accuracy

**Created By:** TAKALANI MASHAU **Reviewed By:** NOMKHOSI **Version:** 01

**Tester's Name:** KELEBOGILE MAKHUDU **Date Tested:** 22 September 2023

**Prerequisites:**

1. Access to Chrome, Safari and Microsoft edge browser
2. <https://www.roomserve.com>

**Test Data:**

- Valid customer account
- Payment method details Valid customer account
- Booking details

**Test Scenario:** Check the accuracy of billing and correct payments

| Step# | Step Details  | Expected Results | Actual Results | Outcome |
|-------|---|------------------|----------------|---------|
| 1.    | Navigate to <a href="https://www.roomserve.com">https://www.roomserve.com</a> | Site should open | As expected,   | pass    |

[Type here]

|    |  |   |              |      |
|----|--|---|--------------|------|
| 2. | Click on the login option                            | Display screen with log in details required (username and password), close and log in option below                        | As expected, | pass |
| 3. | Enter valid credentials to log in                    | Display home page with menu(categories)   | As expected, | pass |
| 4. | Click on one of the options on the menu              | Display services on that option, with picture, price, service name and description  | As expected, | pass |
| 5. | Select a service and click add to reservation button | Pop up screen with confirming "reservation added"   | As expected, | pass |
| 6. | Click the reservations option                        | Display all the services added with their pictures, name, price, option to delete, total amount and make a booking option | As expected, | pass |

**Test Case ID:**TC\_SECURITY\_04 **Test Case Description:** Verify security when logging in

**Created By:** TAKALANI MASHAU **Reviewed By:** IVA **Version:** 01

**Tester's Name:** KELEBOGILE MAKHUDU **Date Tested:** 22 September 2023

**Prerequisites:**

1. Access to Chrome, Safari and Microsoft edge browser
2. <https://www.roomserve.com>

**Test Data:**

- Username
- Password

**Test Scenario:** Test security when log in into an account

| Step# | Step Details  | Expected Results   | Actual Results | Outcome |
|-------|---|--|----------------|---------|
| 1.    | Navigate to <a href="https://www.roomserve.com">https://www.roomserve.com</a> | Site should open and show an interface with hotel name, home, contact, about us, booking, log in, sign up options. A menu (categories) below with the services they offer. | As expected,   | pass    |

[Type here]

|    |   |  |   |      |
|----|---|--|---|------|
| 2. | Click on the log in option                | Display screen with log in details required (username and password), close and log in option below | As expected,                            | pass |
| 3. | Enter valid credentials to log in         | Display home page with menu(categories)  | As expected,                            | pass |
| 4. | Click the login button                    | Display screen with log in details required (username and password), close and log in option below | As expected,                            | pass |
| 5. | Enter valid username and invalid password | Pop up screen display "wrong password"   | As expected,                            | pass |
| 6. | Enter invalid credentials                 | Display screen with message "user does not exist"  | As expected,                            | pass |
| 7. | Enter invalid username and valid password | Display screen with message "user does not exist"  | Display home page with menu(categories) | fail |
| 8. | Enter invalid credentials                 | Display screen with message "user does not exist"  | Display home page with menu(categories) | fail |
| 9. | Enter valid username and invalid password | Display screen with message "user does not exist"  | Display home page with menu(categories) | fail |

**Test Case ID:** TC\_STRESS\_05 **Test Case Description:** Verify if the system is stable and reliable

**Created By:** TAKALANI MASHAU **Reviewed By:** IVA **Version:** 01

**Tester's Name:** KELEBOGILE MAKHUDU **Date Tested:** 22 September 2023

**Prerequisites:**

1. Access to Chrome, Safari and Microsoft edge browser
2. <https://www.roomserve.com>

**Test Scenario:** Stress: reliability and stability testing

| Step# | Step Details  | Expected Results                | Actual Results | Outcome |

## 4. TEST SUMMARY REPORT

Roomserve is an innovative hotel management system designed to streamline the processes of room bookings, check-ins, and billing for hotels. This advanced system enables multiple users to access and manage reservations simultaneously, significantly reducing the likelihood of overbookings and ensuring that guests receive a seamless experience upon arrival. With Roomserve, hotel staff can efficiently track room availability in real time, allowing them to respond promptly to new bookings while maintaining accurate records. The system's robust features include automated notifications for both guests and staff, enabling smooth communication throughout the booking process. Additionally, Roomserve incorporates a comprehensive billing management feature that accurately calculates charges and generates invoices, minimizing errors and enhancing customer satisfaction. By integrating these functionalities into a single platform, Roomserve not only improves operational efficiency but also enhances the overall guest experience, making it an essential tool for modern hospitality management.

RoomServe offers conference hosting, restaurant, day visits and night visits. This system allows customers to get into it and view the menu without signing up.

### Assumptions:

- Display an interface that shows a hotel name on top, followed by Home, Contact, about us, bookings, Sign up and Log in options below the hotel Name.
- Display a menu (categories) of the services they offer which are:
  1. Day visits
  2. Night Visits
  3. Restaurant
  4. Conference hosting
- Display services with their Type, Price and Details like room size, availability and duration.
- It must allow users to select options, view options, show total amount of options.
- Show details of the services like Picture, Type, Price and a delete option.
- An option to make a booking.
- Before making a booking, the user is required to fill in Personal details, Address and card details, contact details and an option to close is displayed.

After filling in all the required details and clicking the booking button, a pop-up screen confirming booking successfully with details like booking ID, Amount, Card number, Customer Name, Date and Ok button.

### Documents created as part of testing:

- Test plan
- Test case Specification
- Test Design Specification
- Test Procedure Specification
- Test data
- Test Environment setup
- Test strategy
- Test summary report

[Type here]

## Tasks to be performed:

- Test planning
- Test monitoring and control
- Test analysis
- Test design
- Test implementation
- Test execution
- Test completion

## PASS/FAIL CRITERIA

test plan uses black box testing, it is using Equivalence partitioning and State transition techniques, so the process will follow these steps of black box as it follows:

- Analyze the requirement specification document because we know nothing about the internal workings of the system.
- Valid inputs and invalid inputs will be chosen based on the requirements specification document.
- Test cases are created for valid and invalid inputs.
- Tests are executed for both valid and invalid inputs.

The actual output and the expected output for valid inputs are compared, if actual output is equal to the expected output, then the test is passed.

The actual and expected out for invalid inputs are compared; if the actual output is equal to the expected output, then the test has passed.

Then a conclusion will be made as for the proper functioning of the website under test.

## DEFECTS FOUND

The problem that we encountered was with the payment process and contact feature of the site, when we enter invalid inputs on the payment process it does not sense or recognize that the inputs are invalid. It allowed us to continue with the payment and the order was placed. For the card number it was not supposed to allow various characters to be entered, if so then the payment process must not proceed. A card number has limited numbers so even if the user exceeds or does not reach the exact number the site must not proceed with payment. Again, for the year it was supposed to display the year automatically because as we were testing its does let the payment process proceed even though the user entered previous year not current year.

Contacting this site let users send empty messages and that will be an issue as we assumed that it may be used for reviews and comments about the site from customer/ users, it can also be used by a customer who wants to complain about an order. So, as it allows empty messages to be sent this means that a lot of useless or meaningless information will be stored in the database which will not help the store management to get feedback about their products and services.

[Type here]

The developers must specify the datatype and length in the development process to avoid such issues. If the field is for numbers only then no characters must be allowed to be entered same as for characters no numbers must be allowed, then if it's a combination then also the datatype and length must be specified.

Also testing can be performed at the development process to avoid find errors/ bugs at a later stage. These bugs were identified as we were using both IOS and Android operating systems on mobile phones and laptops.

These identified bugs are a problem to end user and business because if the site let the user place an empty order this will cause confusing in marketing and sales personnel who receives orders, also the user's money will be taken for an empty order that will also cause confusion on accounting and finance who is responsible for the cash flows of the business. For a business to receive empty or Meang less messages will also be a problem because the information is used for analysis purposes, decision making and other business purposes.

The bug on payment process affects the whole business process or the purpose of this e-commerce site. The impact is huge because if the site cannot sense that the card number doesn't not match the users name it means the security is not good enough. Also, if it does not sense invalid inputs that means some people will enter or can enter other people's details.

I would suggest that the testing must happen throughout the process of developing, also on the payment part developers must have datatypes with lengths, when the user pays the must be a notification that the user will receive on the cellphone number entered to verify if he/ she is paying to make sure that no one is using other people's details.

For contact option the site might be designed strictly not to accept empty messages.

## TEST COVERAGE

### Booking Management

- Booking creation
- Booking editing
- Booking cancellation
- Booking status update

### Payment Processing

- Payment gateway integration
- Payment processing success/failure scenarios

### Guest Management

- Guest profile creation

[Type here]

- Guest profile editing
- Guest check-in/check-out

## RECOMMENDATIONS

1. Regular software updates
2. Continuous staff training
3. Periodic Security audits
4. System Scalability
5. Guest feedback mechanisms

## 5. CONCLUSION

In conclusion, the development of a hotel management system for handling room bookings, check-ins, and billing represents a significant advancement for the hotel. This system not only addresses critical operational challenges, such as preventing overbookings and ensuring accurate billing, but also enhances overall efficiency by allowing simultaneous user access. The integration of real-time data and automated processes allows the hotel to provide a seamless experience for both guests and staff, fostering higher levels of customer satisfaction and operational reliability. By minimizing human error and streamlining workflows, the hotel can maintain a competitive edge in the hospitality industry. Moreover, the system's ability to generate insightful analytics empowers management to make informed decisions, optimize resources, and adapt to market trends. As the hotel continues to refine and enhance this system through training, integration, and feedback, it will be well-positioned to meet the evolving needs of guests and respond to the dynamic environment of the hospitality sector. Ultimately, this initiative underscores the hotel's commitment to excellence in service delivery and operational effectiveness, paving the way for sustained growth and success.

## 6. REFERENCES
